## Experience, explore and exploit Rapid Manufacturing

### What is RM Master Class?

RM-Master class is a 1-day training program aimed at design and manufacturing engineers, business managers, academics and staff running technology centres and R&D facilities. RM Master Class has been developed to provide delegates within a one day course containing the essential knowledge and tools needed to gain the most out of current additive layer manufacturing technologies for production manufacturing applications.

### What does RM Master Class involve?

RM-Master class takes you through the underlying principles and business benefits of Rapid Manufacturing before introducing you to current and emerging polymeric, metallic and ceramic RM technologies. RM Master class then moves on to look at the design benefits

of RM and the material considerations of the technology, before considering the strategic implications and supply chain issues surrounding the use of RM. Throughout, RM Master Class is supported through real-life RM case studies, video footage of technology applications and users and detailed process animations.

### How will you benefit from RM Master Class?

Through RM Master Class delegates are introduced to a structured RM implementation methodology, supported by both course notes and an interactive RM resources CD-ROM.

More details on RM Master Class can be found on-line at:
